Engineering Edition

5 Engineering Workflows to Ship Faster
and Smarter

Auto-Debug Workflows

Turn every incident into an opportunity to learn faster.

Prompt

“Scan Jira tickets, Slack threads, and support logs for recurring errors or latency mentions. Cluster similar incidents, summarize probable causes, and flag any pattern that requires escalation.”

Auto-Generate Technical Docs

Your codebase evolves daily, your documentation should too.

Prompt

“Pull function and module details from recent commits and docs. Draft updated summaries and examples for review, ready to add to Confluence or Notion. Highlight contributors and key weekly changes.”

Sprint Review on Autopilot

Real-time visibility into what's done, what's blocked, and what's next.

Prompt

“Summarize all closed Jira tickets and merged PRs for the sprint. Include time-to-resolution, top blockers, and velocity metrics. Send formatted recap to Slack and attach to the sprint board.”

Real-Time Incident Monitor

xdge monitors alerts, logs, and support pings to flag anomalies, notify the on-call engineer with full context, and schedule a follow-up review once resolved.

Prompt

“Continuously monitor system alerts, error logs, and support pings. Detect unusual spikes, map probable causes, and ping the on-call engineer with context, then auto-schedule a review to prevent repeat incidents.”

xdge

Release Notes That Write Themselves

xdge keeps every release documented, synced, and shared instantly.

Prompt

“Aggregate change logs, commit summaries, and QA notes from internal tools. Generate formatted release notes that capture what’s new, fixed, and improved and send to #product-updates Slack channel.”
