

9Line + SENTRY GeoCell™

How valuable would it be to instantly know where a cell phone is located within a specific geographic area—especially during an emergency?

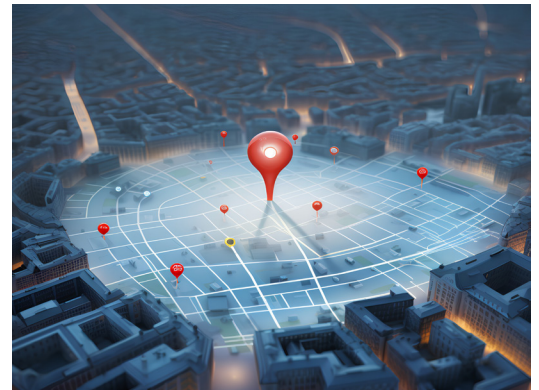

At 9Line, our mission is to ensure every 911 call gets the response it deserves—with speed, accuracy, and clarity. That's why we're proud to offer our customers access to SENTRY GeoCell™, a cutting-edge geofencing solution through a partnership with 911 Secure.

Smarter Location Detection with Geofencing

SENTRY GeoCell™ enhances emergency response by providing real-time awareness when a 911 call is made from a cell phone on a campus, facility, or workspace. Using geofencing technology, organizations can define virtual zones known as GeoCells. When a call occurs within a zone, on-site teams are notified immediately, helping ensure a faster, more coordinated response.

When a 911 Call is Placed

Internal safety teams are immediately alerted when a 911 call is made from a cell phone, providing location information to onsite personnel so they can guide emergency responders to the caller.

High-Level Features:

- Custom Geofencing: Create geofenced zones around buildings and/or campus areas.
- Automatic Address Mapping: Link geofences to civic addresses.
- Emergency Notifications: On-site personnel receives immediate information when someone dials 911 from a cell phone within a GeoCell.
