

CARDLAB ACCESS CARD FOR FIRST RESPONDERS

Imagine you're a first responder, rushing to the scene of an emergency. Every second counts, and the lives of the people you're about to help are depending on you. In a high-stress situation like this, you need to be able to access the information and equipment you need as quickly and easily as possible. That's where a card with a biometric sensor comes in.

With a CardLab Access biometric sensor card, you don't have to remember any complicated passwords. Instead, simply place your finger on the sensor on the card, and you'll be instantly identified. This not only saves valuable time, but it also increases security by ensuring that only authorized individuals have access to sensitive information.

Another advantage of a biometric sensor is automation. With integrated systems, you can use your biometric sensor to log into computer systems or access secure areas without having to manually enter your information. And during pandemics, biometric sensors enable secure contactless identification which is important to reduce the spread disease.

All in all, CardLab Access biometric sensor cards are a reliable, convenient, and secure way for first responders to identify themselves, and ultimately help them to save lives.

Access card – at a glance:

- Match on card fingerprint sensor for verification
- No requirement to upgrade installed readers

- Supports multiple reader types via RFID
- User artwork according to card industry standards
- Multiple personalization options

- GDPR compliance through identity tokenization

Solution benefits: The Access card has been designed to work with multiple readers and can work with existing infrastructure. Biometric data is stored only on the card so there is no requirement to manage databases of biometric data with the inherent hacking risk that goes along with it. With an RFID or optional contact or Bluetooth interfaces, Access can serve as the authentication devices for any host platform including tablets, PC's, door locks and other terminals, and will function without any special upgrades to the backend as all is based on authentication API's. Only by presenting the correct, registered finger, can the card and any stored data be activated and prove your identity.

Are you ready to secure your organization?
