

## Precision In Progress

In the next six months, aCe will be pushing the boundaries of what's possible. Every component of the car will be scrutinized and improved, and crucial decisions will be made to ensure the peak efficiency of our next-generation solar car.

Soon, Silvretta will receive a new electrical system and undergo targeted upgrades and optimizations to the mechanical system to improve reliability and performance. These improvements will be tested, evaluated and iterated on until they are ready to be implemented in our third generation solar car.

With the release of the new regulations for the BWSC 2027, the design of our new solar car can be fully finalized before the ETH summer examination season this July, where we will go on a break for two months.

We are moving with purpose, perfecting the details that will make the difference between finishing and leading the race.
