CAPABILITY SHIFT

Claude Tag is a Slack-based AI agent for team channels. Admins can grant Claude access to selected Slack channels, tools and data. Channel members can tag @Claude to delegate tasks. Claude can remember relevant channel information and, when ambient behaviour is enabled, proactively flag information or follow up on unresolved threads.

ORGANISATIONAL CONSEQUENCE

Claude in Slack is no longer only a request-response assistant. A channel-level Claude can accumulate context and act with more initiative where enabled. What one user asks or delegates may shape later responses in the same channel. This creates new questions about channel scoping, memory boundaries, task attribution and proactive AI participation.

WHAT TO WATCH

- Claude appearing in channels where sensitive work is discussed
- Responses that reference earlier channel context
- Proactive updates or follow-ups when ambient behaviour is enabled
- Tasks delegated to Claude across channel threads
- Staff treating Claude as a channel participant, not just a tool

WHY THIS MATTERS NOW

Claude Tag is available in beta for Claude Enterprise and Team customers. Organisations evaluating the integration may be assessing a different operating model: not a Slack chatbot, but a channel-level AI participant with memory and initiative.

WHAT TO REVIEW

- Which Slack channels Claude can access
- Whether memory is scoped to approved channels
- Whether ambient behaviour is enabled
- Whether logs show who requested each Claude task
- Whether acceptable use policies cover proactive AI participation

GOVERNANCE CONTEXT

This is a visibility and authority issue. Claude Tag can make AI participation part of the channel workflow itself. Leaders may need to address what Claude remembers, who can delegate tasks, what triggers proactive action and how logs are reviewed.

Scope Boundary: This artefact translates observed platform capability changes into operational considerations. It does not constitute policy, legal advice, or enforcement guidance.
