

MODULE OVERVIEW

Thumbprint Match

Put your last trial's recruitment to work on the next one.

Thumbprint is the patient relationship layer for clinical research: a standing pool where research-willing patients from a sponsor's trials can choose to stay connected for future studies. With their permission, records are retrieved continuously across sites of care, building a more complete, up-to-date picture of each patient's health history. When a new trial launches, Match pre-screens patients in the pool against its inclusion and exclusion (I/E) criteria to connect study teams with patients who may qualify.

How patients join

Patients join the pool during your active trials. With Extend, participants can choose to stay connected beyond database lock. With Bridge, sites invite patients who screen fail to join at their screening visit. Match then pre-screens patients in the pool for each new trial. Add modules as you need them.

Explore all Thumbprint modules →

- **Up to 80%** of I/E criteria verified before the first site visit
- **Fewer** screen failures

Ready when you are

Activate Thumbprint Match to support enrollment in your next trial:

Query patient records
Run the trial's I/E criteria against each patient's records to identify potential matches

Re-engage patients
Invite patients who may qualify to learn about the trial, using automated and white-glove outreach

Verify and connect
Confirm up to 80% of the I/E criteria, then connect sites with pre-screened patients

Your next trial doesn't have to start recruitment from scratch. Let's talk about Match for your trial.
