

Thumbprint

PRODUCT OVERVIEW

Thumbprint: the patient relationship layer for clinical research

Give every patient your trial touches the option to stay connected for whatever research comes next.

Up to 80%
of inclusion and exclusion criteria verified before the first site visit

< 5 minutes
for a site to enroll a patient

Patient recruitment is one of the largest investments in clinical research, yet connections with patients often end at screening or at database lock, leaving sponsors to start recruitment from scratch for the next study.

Thumbprint makes the investment in finding and understanding patients valuable beyond a single study. Patients can choose to stay connected, creating a persistent pool of research-willing participants supported by longitudinal health data.

With patients' permission, Thumbprint retrieves medical records across sites of care, enabling pre-screening for future studies and delivering scientific rigor and endpoint fidelity without the match-rate and data-coverage limitations of tokenization.

From one trial to the next

- Give trial participants a way to stay connected beyond database lock
- Close the tokenization gap with more complete, trial-anchored evidence
- Offer future research opportunities to patients who screen fail
- Invite pre-screened patients to your next study
- Support postmarketing requirements and commitments

One pool. Turn on modules as needed.

Every Thumbprint module works with the same pool, which can grow from a single trial to an entire portfolio. Sign once, then activate modules when you need them. New modules are added regularly.

EXTEND

Gives trial participants a way to stay connected beyond database lock, enabling ongoing trial-anchored evidence.
