

Marketplace

Bring third-party applications to your terminal estate, governed from submission to install

Payment terminal hardware is built to run more than one application, yet on most estates the terminal still does one thing: take payment. The reason is not the hardware. It is that there has never been a safe, scalable way to put additional applications on terminals that an operator can control and stand behind. Open app stores bring choice but no governance. Manual distribution brings control but no scale, and no security review

Key Features

App Distribution

A governed path to build, publish, and distribute apps across your estate

Governed Access

You choose which developers reach your estate, with release, targeting, and revocation enforced at the API layer

Built-in Security

Automated security scanning on every submission, with a malware and critical-vulnerability floor that cannot be lowered, and your signature required before anything runs

Estate wide delivery

Estate wide reach Multi-tenancy, organizational targeting, and an on-device store, all inherited from VHQ Next Gen

Full audit trail

Every submission, approval, revocation, and install logged for compliance evidence

Marketplace runs on the same platform you already use to manage software, settings, and device health, so it is one workflow, not a separate system to learn

Why It Matters

The terminal on the counter is capable of far more than payments. What has been missing is a safe way to use it. VHQ Next Gen Marketplace makes adding an application a governed action instead of a manual, unreviewed one: every app is scanned automatically before it enters your catalog, and signed by you before it can run on a device.

Because it is built into VHQ Next Gen, distribution scales. Release, target, or revoke across the whole estate in one action, with multi-tenancy scoping every release to the right merchant, region, or brand, and governance enforced at the API layer, not just the interface

Benefits

- Turn a payment terminal into a platform for merchant services, without deploying separate hardware for each need
- Offer merchants applications from developers you choose, without building or maintaining the software yourself
- Control exactly which applications reach which merchants and devices, and revoke access when needed
- Meet compliance requirements with a full audit trail across every submission, approval, revocation, and installation
- Make applications available across the entire estate from the same platform that manages the rest of it
