

**STOREPICK***For robust operations  
and store-friendly deliveries*

In today's food retail market, consumers demand fresh, high-quality products, and excellent service. They expect their shopping experience to be as stress-free as possible, without aisles blocked by pallets or staff restocking shelves. In addition, there is a demand for high availability of products.

As a result of increasing consumer demands, food retailers must cope with the growing volumes of diversified stock and multiple store formats. They must also factor in the expanding number of SKUs, which has an impact on effective space utilisation.

In addition, stores have strict budgets, and need their deliveries on time and full shelves in the store. Combined with a lack of available workforce at distribution centres (DCs), the automation of core warehouse processes and the ability to provide store-friendly deliveries are vital.

As part of the next generation of scalable solutions – evolutions – Vanderlande offers STOREPICK, which seamlessly integrates innovative systems, intelligent software and life-cycle services. STOREPICK is a robotised door-to-door warehouse solution that facilitates store-friendly deliveries and optimises the entire value chain: from DCs through to transportation, and to individual stores.

## Robust and future-proof operations

Due to STOREPICK's robust design, you can achieve your operational objectives by facilitating late order cut-off times, while maintaining complete control of your warehouse processes. Order handling is also secure, because there is no single point of failure.

System flexibility is guaranteed due to the multi-directional shuttles of ADAPTO (the goods-to-person system) and the use of automated guided vehicles (or AGVs) that can be fitted with all types of load carriers.

The modular design of STOREPICK also makes it easy to scale up the solution to meet future requirements, both in terms of capacity and changing functionalities.

## Efficient transport

While trucks are loaded according to route sequencing, unloading is highly efficient. Carriers are loaded with a high load density based on a multi-store format.

## Store-friendly deliveries

STOREPICK allows you to accommodate store-friendly deliveries due to the way in which it retrieves products in the exact sequence required. It also offers rapid shelf

replenishment for multi-store format deliveries, as well as split-free carrier loads.

In addition, STOREPICK reduces initial investments due to its small footprint whereas operational costs are reduced by making your operations more efficient, while lowering the dependence on manual intervention.

Within the supply chain, STOREPICK also optimises the user experience, resulting in intuitive user interfaces for operators. This reduces the training time required, as well as creating a safer working environment through the elimination of heavy work in both DCs and stores.

Finally, STOREPICK is based on Vanderlande's warehouse platform which ensures that the operational process can be easily scaled and changed to meet future requirements.

**For robust operations and store-friendly deliveries, the optimum solution is Vanderlande's STOREPICK evolution.**
