

Odorization Training Trailers

Hands-On Training, Without the Risk of the Real Thing.

The MRR Odorization Training Trailer is a mobile, fully equipped training platform for hands-on odorizer training, built as a standalone trailer or a truck-mounted unit depending on how it needs to be deployed and stored. It's available as a standard training configuration or engineered to replicate a specific operator's own equipment lineup, so technicians can train on the same models they'll service in the field.

Trains Like the Real Thing, Without the Risk

Actuation gas is simulated using nitrogen or compressed air rather than live natural gas or odorant, so trainees can practice startup, shutdown, and fault scenarios without the safety exposure of working with the actual product. Liquid lines are hard-piped to a DOT-compliant tank with isolation valves, using removable flex connections for transport, so the system is built like a real production setup rather than a simplified mockup.

Customer Value

- Simulated actuation gas — no live natural gas or odorant during training
- Hard-piped to a DOT-compliant tank with isolation valves
- Built like a real production setup, not a simplified mockup

Operated and Monitored Like a Real Facility

Each training station has its own breaker and GFI-protected power, individual controls and displays, and emergency stops, so multiple systems can be run and diagnosed independently in a single session. Integrated gas detection monitors the training space itself — the same safety layer technicians will rely on in the field.

Customer Value

- Individual breaker- and GFI-protected stations with independent controls
- Integrated gas detection monitoring the training space
- A full-scale spill kit included for hands-on spill-response practice

Built to Go Where the Training Is Needed

Whether trailer- or truck-mounted, the platform is engineered around how it will be deployed and stored, so training goes to the technicians rather than requiring travel to a fixed facility. A climate-controlled, sealed, non-slip interior keeps the space usable in real working conditions.

Customer Value

- Trailer- or truck-mounted, engineered around your deployment needs
- Climate-controlled, sealed, non-slip interior
- Configured to replicate your own equipment lineup on request

Why MRR

- Trains technicians on the same equipment models they'll service in the field
- Simulated actuation gas removes the safety exposure of training on the real product
- Integrated gas detection and a full-scale spill kit built in for hands-on safety training
- Goes where the training is needed instead of requiring travel to a fixed facility

Train on the Equipment Your Crews Actually Run

MRR can build a training trailer configured around your own odorization equipment lineup, ready to travel to wherever your technicians need hands-on practice.
