Switch to Virtual Training Software

Making the shift from face-to-face teaching to virtual training can be challenging. Here's a quick guide to help you navigate the transition from face-to-face classrooms to virtual training. Use these handy ReadyTech features to replicate actual face-to-face interactions.

1 Virtual labs

These hands-on exercises give students the practical experience with the actual software. In addition, virtual labs have the added benefit of not having minimum system requirements or local installations: an internet connection is all you need.

2 Public and private chat

Just like in a traditional classroom, instructors can communicate back and forth with individual students or with the entire class.

3 Help request queue

Students requesting help is a vital part of traditional and virtual training. With ReadyTech's help request queue, students can ask for help any time, and it organizes learner questions so instructors can respond efficiently.

4 Screen sharing

With in-person training, instructors used a projector to share their screen with the class. In virtual training, the projector is replaced with screen sharing. And in virtual training, instructors have the added flexibility of sharing any student's screen with the class.

5 Breakout groups

Similar to traditional classroom training, virtual training lets instructors divide a classroom into smaller groups. While students are in smaller groups, they can collaborate on case studies, lab exercises, or resolve a challenge, then present their findings to the entire class.
