

## ASK THE EXPERT

**SALAR HAZANY, MD, FACMS** : Board Certified Dermatologist : **Hazany Derm**  
: & Mohs Surgeon :

**What is minimally invasive Mohs surgery, and how does it differ from traditional approaches of skin cancer removal?**

Unlike standard Mohs surgery, which often requires sutures, minimally invasive Mohs can avoid suturing in about 60% of cases by using more superficial sampling while still achieving up to 99% cure rates. Precise mapping, ultra-thin margins, and tailored closure minimize disruption to healthy tissue, resulting in smaller wounds, less visible scarring, and faster healing—especially in cosmetically sensitive areas like the face while preserving natural contours.

**What techniques are used to revise scars?**

Scar revision is tailored to each scar's type, location, and behavior. Large leaps have been made in treatment in recent years and instruments such as the Hazany Liberator have been shown to provide excellent results against the deepest and most pitted of scars with fewer risks than previous methods. With a personalized, multi-modal approach, many scars—new or old—can be significantly improved over time.

**What are non-surgical options for facial balancing and anti-aging with zero downtime?**

Non-surgical facial balancing enhances natural harmony using a combination of synergistic treatments simultaneously. Exosomes, PRP/PRF, dermal fillers, and biostimulatory injectables applied with gentle laser therapy can rejuvenate and restore a patient's face and enhance skin quality with little to no downtime, allowing immediate return to daily activities with subtle, natural-looking results.
