

PROCELL HAIR REJUVENATION

WHAT TO EXPECT

THE PROCESS

A pre-consultation history form will be sent followed by a complimentary phone or video call to begin the process. This allows us to review your goals, confirm there are no contraindications, and determine possible paths forward. If we decide to proceed, a strategy session will be scheduled. The strategy session is a \$100 in-person appointment applied toward your treatment cost when you book. During this appointment we will review your treatment areas, discuss your complete skin strategy, go over pre-care and post-care protocols in detail, take before photographs, and complete all required forms. A test patch will be performed if indicated. This session is designed so that your treatment appointment is focused entirely on results and time is given for any questions to be answered. Your appointments will be scheduled according to where you are in the pre-care process.

TREATMENT DAY

Please arrive having completed all pre-care steps.

- The scalp will be cleansed before treatment begins
- The Procell device is passed over the thinning areas of the scalp — most clients describe the sensation as mild pressure or light scratching
- Procell Hair Regrowth Serum is applied during and after treatment to maximize absorption through the open microchannels
- Treatment time is typically 30–45 minutes
- The scalp may appear slightly pink after treatment — this is normal and typically subsides within a few hours

FIRST 24 HOURS

- Mild scalp sensitivity, redness, or warmth is normal immediately after treatment
- Do not apply any products to the scalp during the first 24 hours
- Avoid heat styling, heavy exercise, or anything that causes sweating

DURING THE SERIES

- Some initial shedding may occur early in the series as the follicular environment begins to respond — this is normal and temporary
- The Procell serum supports the hair follicle cycling process, helping follicles transition from resting to active growth phase
- Results develop over the course of the series and continue after the final session as the follicular environment keeps responding
- Do not assess results until the full protocol is complete — hair growth cycles are slow and improvement is gradual
- Factors including genetics, hormonal balance, overall health, age, and lifestyle all influence individual response

SERIES PROTOCOL & TIMELINE

- Standard protocol: 6 sessions spaced 2 weeks apart over 3 months
- Results typically become visible 3–6 months after beginning the series as new hair growth progresses through the growth cycle
- After completing the series, maintenance sessions every 3–6 months preserve results and continue to support scalp health
- Consistent daily home care serum use between appointments is essential for optimal results

RESULTS & EXPECTATIONS

- Hair growth results cannot be guaranteed – individual response varies based on genetics, overall health, scalp condition, hormonal influences, age, and lifestyle
- There is no current method to determine with certainty whether a follicle is permanently inactive prior to treatment
- A follicle is generally considered non-responsive only after completing the recommended series with no observable regrowth
- Improvement is gradual – patience and commitment to the full protocol are essential
- Maintenance treatments are recommended to support long-term results

**Individual results vary. No outcomes can be guaranteed.*
