

About us

Strategy and IP platform for bankable structures

2026

EPASUS gives fragmented systems and technologies a unified structure.

EPASUS was born from the need to bring order to complexity.

As a long-standing CEO and board member in start-ups and in smaller, larger and listed companies, Peter Pauli has seen how decisive structure, governance and financing logic are. EPASUS is the consequence.

Origin

Peter Pauli

Founder & Owner Platform Architect

Large systems do not fail for lack of technology, but for lack of architectural clarity.

*Structure before scale
Capital protection by design*

Competencies

Lean structure, clear mandates and competencies

EPASUS operates on the same principle as its platforms: asset-light, structure-led, with clearly defined roles — no operational overhead, full strategic control.

Network model

Lean asset – flexible involvement as projects require

01 Lean asset

Experts and partners are involved as needed — not as a fixed structure, but as part of the platform logic. Full competence without operational overhead.

02 Structure-bound

Clear roles, defined mandates and governance rules apply to everyone involved. The structure leads — not the hierarchy.

03 No overhead

EPASUS ties up capital structurally, not operationally. Maximum competence, minimum committed resources.

04 Replicable

The network model transfers to all platforms: GorSys, GorSol, GeoMoove use the same involvement logic.

The platforms

We structure sustainable value creation.

As a strategy and IP platform, we develop asset-light, bankable structures in energy, medtech and sustainable industrial systems and make future markets financeable and scalable.

Vision

As a system platform, GorSys connects sustainable energy carriers, storage logic and energy generation into bankable, scalable energy systems – structured, asset-light and replicable.

Mission

GorSys structures and designs financeable energy systems for a climate-neutral, storable energy supply. As a system platform, GorSys develops standardised structural, governance and financing models across sustainable energy carriers, storage logics and energy generation. Operational implementation is carried out by industrial, technology and project partners. GorSys remains asset-light and leads through structure and governance.

Vision

Our own projects and our customers generate low-cost energy with application-driven PV modules, components and installations.

Mission

We combine a highly efficient information platform with an application-oriented product portfolio. Customers and our own projects execute cost-efficiently – with a cost-per-energy view. Highly efficient supply chain management enables a material flow that reduces capex and opex. Experienced specialists accompany customers, projects and business processes, strengthen execution, improve the use of resources and increase profitability.

Vision

GeoMoove is EPASUS's medtech structure and market platform. We translate complex medtech technologies into bankable market, service and usage models and scale value via IP, data, services and partnerships.

Mission

GeoMoove develops, operates and scales structured market, service and usage models for MedTech systems on behalf of and in the interests of EPASUS AG. GeoMoove creates value through:

- Structured services (lifecycle, service, MDR)
- IP-related data and usage models
- Standardised partner and market structures

Principles

How EPASUS assesses and structures ventures

01 Structure before scale

Bankability is not a final check, but a design principle from day one.
Structure first, then growth.

02 Capital protection by design

Risks are limited through contracts, governance and decision filters instead of being managed in operations. The downside is defined, the upside stays open.

03 Governance instead of dependency

Decision, governance and IP rights are contractually secured.
Projects remain independent of individual people or partners.

04 Defined value realisation

Licence, royalty and participation models with a clear exit logic are part of the structure – settled before capital flows.

Boundaries

What EPASUS deliberately does not do

01 No operational mixing

Energy and medtech structures are not mixed. No platform serves another as an operational resource.

02 Operating companies kept separate

Operating entities are kept legally and financially separate. EPASUS holds strategy, IP and governance; risks stay where they arise and remain individually assessable for investors.

03 No own operations

No own device manufacturing, no permanent clinic operations, no high pre-financing of hardware. Implementation runs through industrial and project partners.

04 No capital tied up in operations

EPASUS ties up capital structurally rather than operationally. That protects capital and keeps the platform scalable.

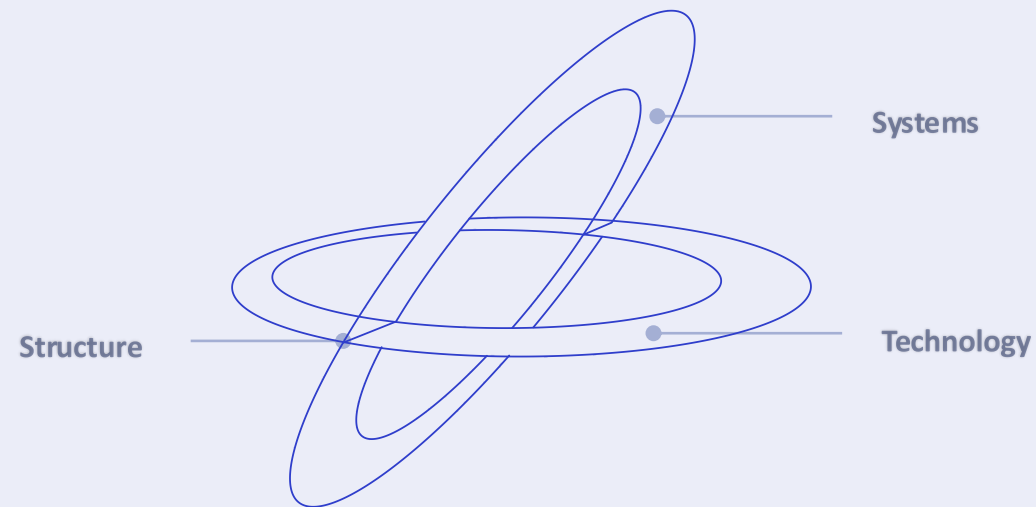

We make sustainable markets bankable — before others operate them.

Structure that carries capital
