

Building cardiovascular expertise in Angola through international collaboration

The Cardeal Dom Alexandre do Nascimento Hospital Complex (CHDCP) has taken another important step in strengthening cardiovascular healthcare in Angola with the launch of an advanced Cardio-Tomography training programme for healthcare professionals.

Delivered by Professor Gianluca Pontone of Italy's renowned Monzino Cardiology Center, the five-day programme brings together doctors, imaging specialists, and healthcare professionals from across CHDCP to enhance their expertise in a critical area of cardiovascular diagnosis and patient care.

Combining both theoretical and practical learning, the training aims to deepen participants' knowledge and skills in the use of Cardio-Tomography, an essential tool for the diagnosis and monitoring of cardiovascular diseases.

The initiative is part of the ongoing partnership between Angola's Ministry of Health and Azule Energy, which continues to support efforts to strengthen healthcare services through capacity building, knowledge sharing, and access to international expertise.

By connecting Angolan professionals with leading centres of excellence, the programme contributes to the development of local capabilities and the enhancement of specialised healthcare services in the country. It also reinforces CHDCP's commitment to continuous professional development, innovation, and the delivery of high-quality healthcare to Angolan families.

At Azule Energy, we are proud to support initiatives that create lasting impact by investing in people, strengthening institutions, and helping build a healthier and more sustainable future for Angola.
