

Agogo FPSO reaches highest production since First Oil

Azule Energy has achieved a significant operational milestone at the Agogo FPSO, recording its highest production rate since first oil while maintaining zero routine flaring.

The achievement follows the successful tie-in of Agogo early production wells, and ongoing implementation of production optimization initiatives across the asset. These combined efforts enabled the FPSO to reach a production rate of 80.15mbd.

Achieving record production while maintaining zero routine flaring further highlights Azule Energy's commitment to responsible and efficient operations, minimizing environmental impact.

This accomplishment reinforces the company's focus on operational excellence, innovation and safe, reliable energy production as it continues to support Angola's energy sector and future growth.
