

Fudo Enterprise — Privileged Access Control

Who it's for

Fudo Enterprise is designed for professionals responsible for security and compliance within their organizations — CIOs, CISOs, as well as audit and IT operations teams. The system performs seamlessly across on-premises, cloud, and hybrid environments.

Business impact

Fudo Enterprise significantly reduces the risk of privileged access misuse. With full session visibility, it enables rapid detection of irregularities and effective incident response. Comprehensive session recordings streamline audits, while the agentless deployment ensures quick implementation and a fast return on investment.

Solution overview

Fudo Enterprise acts as a central access gateway for privileged users, intercepting and recording RDP, SSH, HTTP/S, and other sessions. The solution incorporates AI-powered behavioral analysis to assess risk in real time. Access can be granted temporarily, following a just-in-time policy that removes the need for permanent privileges. The platform integrates easily with identity directories, MFA systems, and SIEM tools, while its extensive API enables advanced automation.

How it works

A user connects to the target system through Fudo, which enforces security policies and mediates the session. Every activity is recorded and tagged with metadata, while built-in AI mechanisms continuously analyze behavior to detect anomalies. The data can then be exported to external systems or analyzed directly within Fudo.

Fudo Enterprise — Privileged Access Control

Architecture and Modes

Fudo recommends using proxy and bastion modes to ensure the highest level of control and security. The system also supports automation through a modern, well-documented API.

In the context of regulations

Fudo Enterprise helps organizations meet regulatory requirements such as NIS2, DORA, and ISO 27001. It provides a complete audit trail and all the data necessary for preparing regulator-required documentation.

Why Fudo

The system stands out with its agentless architecture, which significantly accelerates deployment. Its advanced session control layer and AI-powered analysis reduce the time needed for audit review. Fudo is a trusted PAM solution, developed by cybersecurity experts with many years of experience in the field.

Discover the capabilities of Fudo Enterprise

We encourage you to conduct a short pilot project (POC). During the trial, you can test session recording for RDP, SSH, HTTP/S, and other protocols, apply just-in-time access policies, and integrate with directory services, MFA, and SIEM systems. This allows you to quickly experience the real value of Fudo Enterprise in action.
