

Which key IT monitoring and information security tasks can be solved with Fudo PAM?

1. Full control of the privileged users work (administrators of important IT systems of the organization) – video recording of all sessions with the ability to conduct text search within, response to keyboard input (including blocking dangerous commands), protection from deletion of log files and abuse of authority from IT-admins
2. Secure single entry point – implementation of two-factor (MFA) authorization for working with important IT systems, password management and protection against their leaks (passwords are securely hidden from authorized users)
3. Automation of access rights management – easy adjustment of access by schedule, integration with ServiceDesk and ticketing systems for automatic provision of access upon an approved request, self-service request by users and its approval by relevant Fudo admins from management console or using a special mobile application (available on iOS and Android)
4. Detection and blocking on the fly (in less than 60 seconds) of illegal transfer of access to third parties, control of user work efficiency in sessions (graph view of the real activity and session duration – useful for control of labor costs and contractors' estimates)
5. Secure connect of remote privileged users (both employees of the organization and contractors or vendors) without the need for an insecure and outdated VPN approach, instantly from any browser
6. Ability to monitor users' work in real time and respond instantly to their actions (applicable for SOC tasks)

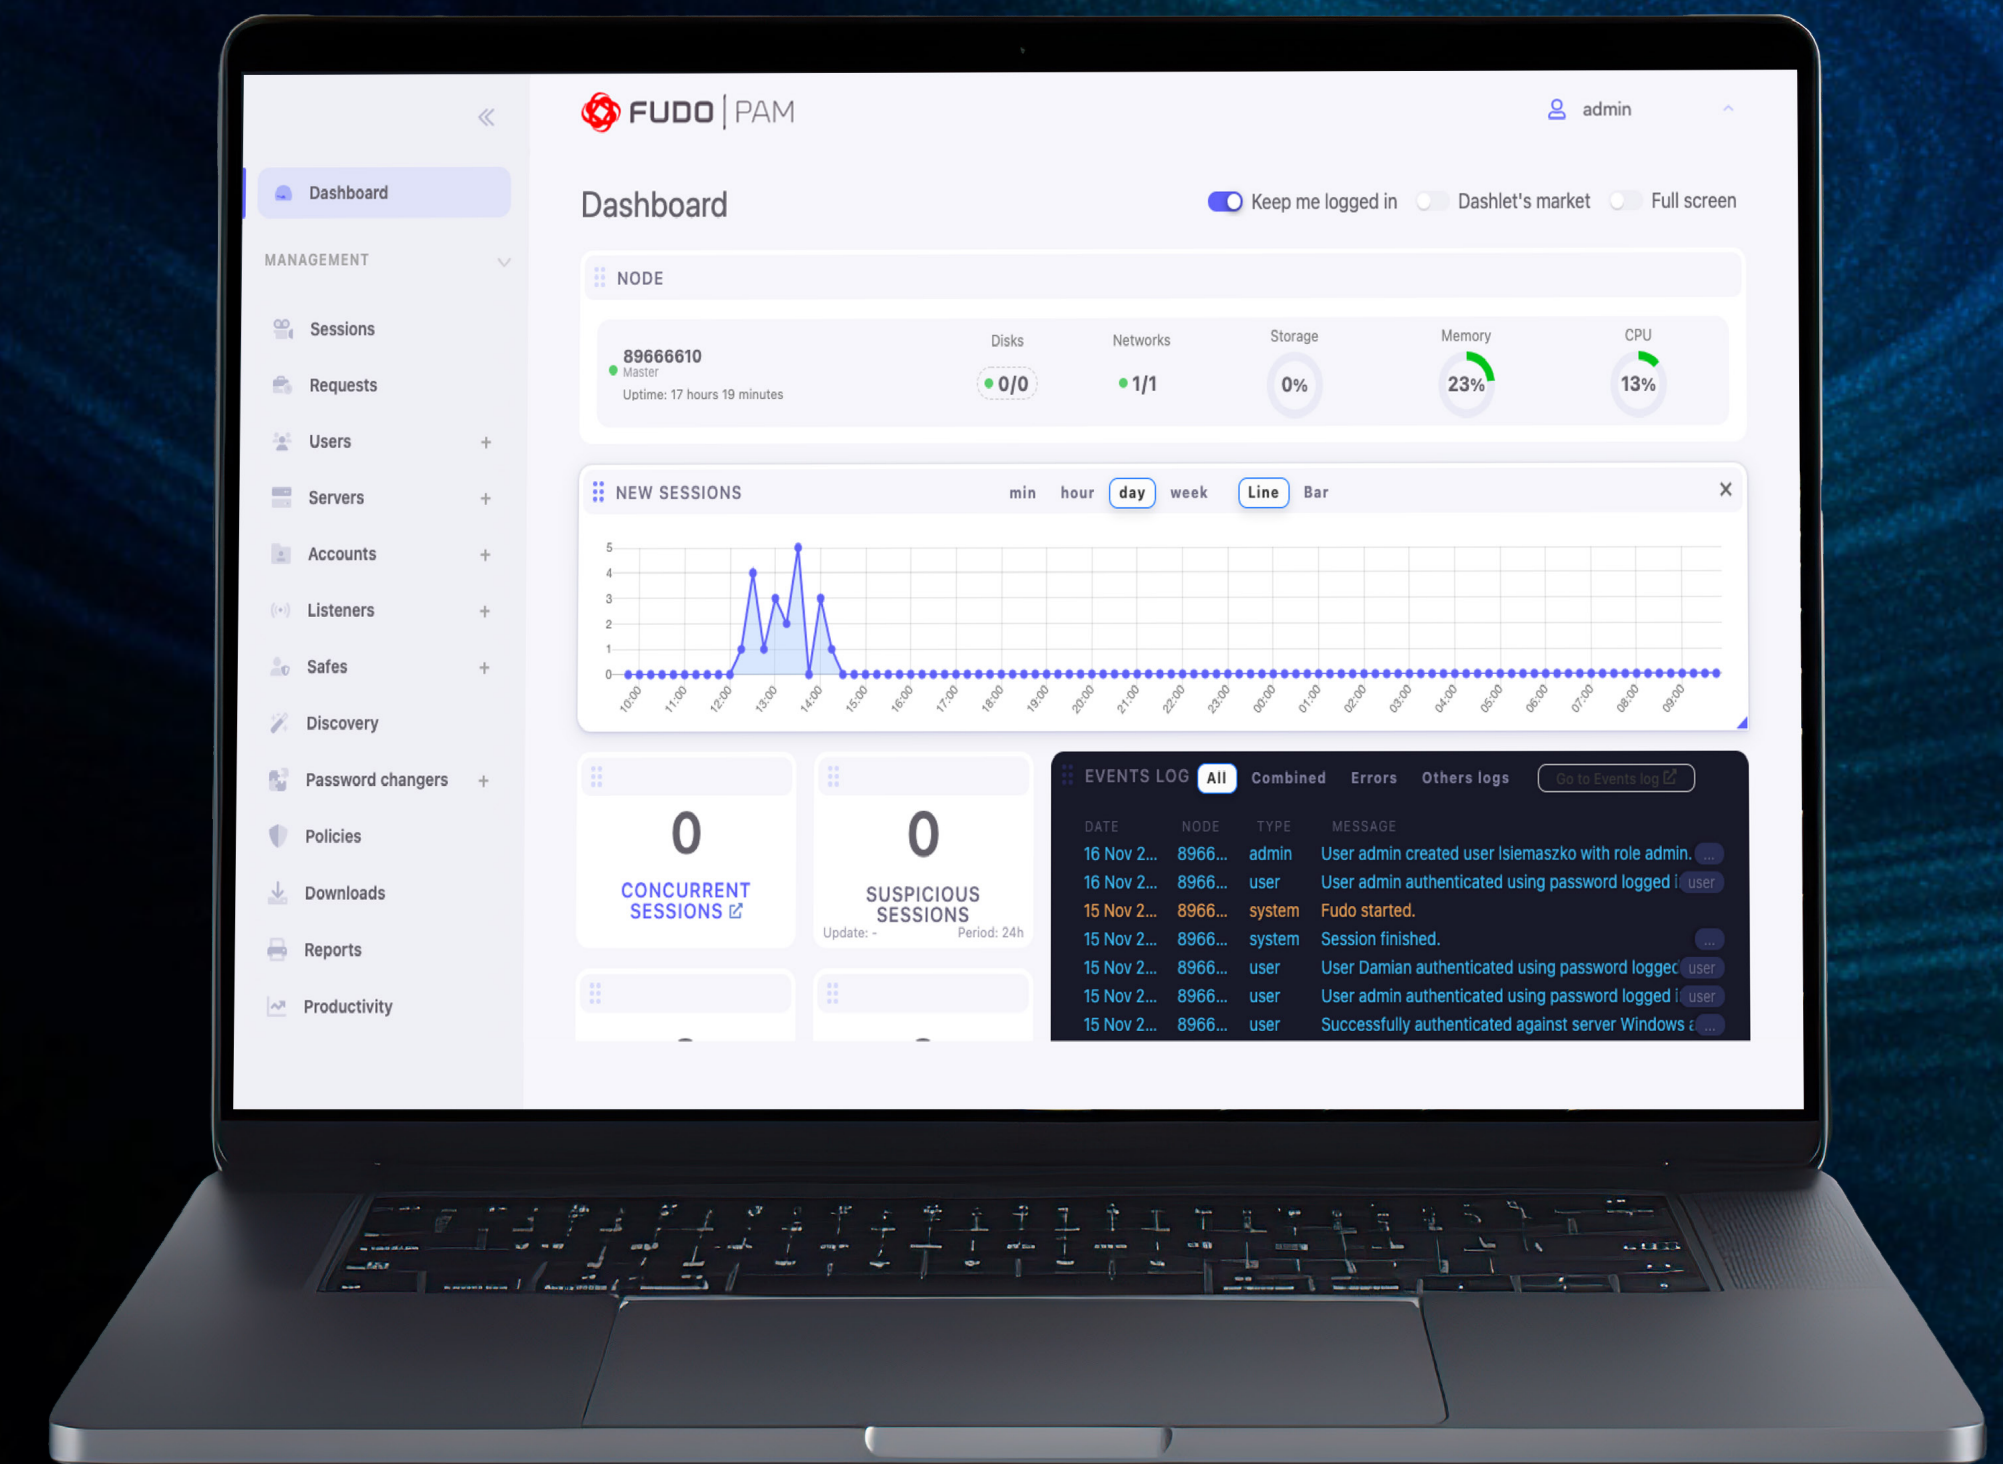

Fudo – leading & most effective Next GEN Privileged Access Management with embedded AI and real time prevention

5 points, the secrets of Fudo's domination:

1. Quick start-up (implementation in just 1-2 days!), totally on-prem and ease of use- modern user interface with a customizable dashboard, mobile application for quick access management and implementation of Zero Trust approach
2. Built-in advanced technologies at no extra charge - OCR with support for national alphabets, continuous monitoring of behavioral biometrics with the ability to block (analogous to session antifraud), efficiency analysis, etc.
3. Reliability and protection - there is no way to bypass control (no agents on endpoints and target systems!), built-in cluster for HA and scalability (active-active).
4. Fudo Share Access - Advanced platform for managing and organizing the work of remote users (including third-party organizations) without need of VPN/plugins and with instant & secure connection from any browser!
5. Flexible choice of license type (CAPEX -perpetual) / OPEX -subscription) and licensing model - by systems (with unlimited users!) or users (with unlimited systems) Enable Customers' employees to work safely from any mobile devices.
