

Acquire the Company. Not the Security Gaps.

See, fix, and continuously validate the security controls you inherit.

THE CHALLENGE

M&A Introduces a Security Environment You Don't Fully Know

An acquisition brings new users, assets, security tools, configurations, and policies into the business. But before those environments are connected, security teams often lack a reliable way to know whether the acquired company's controls are configured correctly, aligned with policy, or protecting the business as intended.

The challenge only grows during integration. Threat exposure changes, security tools and policies are consolidated, and configurations continue to evolve. Security teams need to know what they are inheriting, what needs to change, and whether the combined environment stays secure over time.

THE SOLUTION

Bring the Acquired Environment Into Focus

Reach gives security teams a clear view of how the acquired company's security controls are configured and how effectively they protect the environment. Reach identifies misconfigurations, control weaknesses, gaps in coverage, and configuration drift, then

helps teams prioritize and remediate the issues that matter most. As the companies integrate, Reach helps align controls with the acquiring company's security standards and continuously validates that they stay aligned.

Know What You're Inheriting

Establish a clear baseline of the acquired company's security posture across its existing controls. Identify misconfigurations, weaknesses, underused capabilities, and gaps that could introduce risk when the environments connect.

Reach can also show how the combined threat landscape changes after an acquisition and where existing controls may need to adapt.

Bring Security Into Alignment

Prioritize the gaps that create the greatest risk and bring the acquired environment in line with the acquiring company's security standards.

Reach helps teams determine what needs immediate attention, remediate control weaknesses, and inform decisions around policy alignment, security tool consolidation, and migration.

Keep the Combined Environment Secure

Security posture continues to change long after the initial assessment.

Reach continuously monitors for configuration drift and validates that controls remain aligned with intended security policy as environments, users, tools, and infrastructure change throughout the integration.

How Reach Supports the M&A Journey

A clear path from assessment to ongoing assurance

One Process. Two End States.

Remain Separate

Maintain distinct security environments while giving the parent organization centralized visibility and ongoing assurance across both entities.

Fully Integrate

Assess the acquired environment independently, remediate priority gaps, and transition controls into the parent company's security model.

Know Where You Stand at Every Stage

Make security part of a confident integration

See how Reach can help you assess, secure, and continuously validate the security controls you inherit through M&A.
