PathGlow

Reveal hidden rodent movement.

Fluorescent tracking dust that gives pest-control professionals clearer evidence of where activity is happening and where to investigate next.

tolbest

Turn hidden activity into visible evidence

Rodent activity is not always easy to pinpoint. There may be clear signs that rodents are present, but understanding where they are moving, how they may be entering a site or whether activity is continuing requires a closer look.

PathGlow gives pest-control professionals visible evidence to work with. Apply a light dusting around the area being investigated and, as rodents move through it, they leave footprints and trails behind. These can be seen during inspection, with visibility significantly improved under UV light, helping reveal movement that might otherwise be missed.

For commercial and residential pest-control surveys, that clearer picture can help teams map movement routes, investigate suspected ingress points and focus further inspection where there is evidence of activity, rather than relying on guesswork alone.

Features

Reveals rodent movement patterns not visible to the naked eye.

Visibility significantly improved under UV lamp inspection.

Simple to apply – a light dusting around the suspect area.

Residue removes easily with a suitable cleaning agent.

Made to be straightforward

PathGlow is designed to be straightforward to specify, supply and use, with a clearly defined purpose and the technical information needed to support it.

Whether you're carrying out inspections on site, responsible for pest-control provision across a site or contract, or stocking and supplying the product to customers, you need something dependable that is easy to understand and use with confidence.

By making rodent activity visible, PathGlow can also support a more targeted approach to monitoring and control, helping teams focus attention where there is evidence of activity rather than treating areas blindly. Once its job is done, the residue is designed to be cleaned away.

A clearer view of rodent movement

Reveal what you cannot normally see

Footprints and trails show where rodents have passed through the treated area.

See more under UV

Inspection under a UV lamp significantly improves visibility and can reveal movement that might otherwise be overlooked.

Simple to put into practice

Apply a light, even dusting around the suspect area and inspect for footprints and trails following activity.

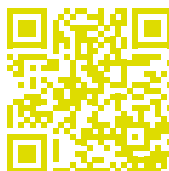

Easy to clear away afterwards

Once monitoring is complete, residue can be removed using a suitable cleaning agent.

Datasheets

Typical Applications

Map movement routes

See regularly used paths through a site, including areas where activity is not otherwise obvious.

Identify possible ingress points

Use visible tracks to support investigation around suspected points of entry.

Monitor continuing activity

Look for fresh tracks to establish whether rodent movement is continuing.

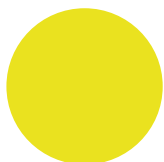

Support pest-control surveys

Add clear visual evidence to commercial and residential pest-control investigations.
