

Fivetran Business Critical

Fivetran's highest level of data protection and compliance

- The most reliable and secure cloud data integration platform
- PCI DSS Level 1 certification for critical payment data protection
- Advanced security options including customer managed keys and private cloud connectivity

Your enterprise data is yours to use and protect

Ensuring that data from the source arrives reliably in the target destination is challenging. Protecting sensitive data in flight and meeting industry and internal compliance requirements adds another level of complexity.

Enterprise security teams are responsible for controlling access to data sources and destinations, meeting regional data residency requirements, and securing sensitive data in alignment with compliance regulations.

In order to protect data, these teams need a reliable and secure cloud data integration platform that automates data integrations as well as manages data security while in transit.

Secure your data with Fivetran Business Critical

Fivetran Business Critical is the most reliable and secure cloud data integration platform. Business Critical brings together simple, automated pipelines and our highest level of data protection. We support the needs of enterprises with extremely sensitive data, that are subject to regional data security requirements, and that must meet industry compliance measures such as HIPAA, HITRUST and PCI.

How are customers using Business Critical?

Secure Data Connection Options

Use a private connection to prevent data from exposure to the public internet, reducing security risks. Private networking is available for key sources and destinations including Snowflake, Amazon Redshift, Databricks, SQL Server, Oracle, Postgres, Salesforce, Amazon S3, Azure Blob Storage and more.

Maintain Regulatory Compliance

Fivetran has the highest levels of compliance than any other SaaS cloud data integration platform, including CCPA, GDPR, HIPAA, HITRUST, ISO and SOC2. Fivetran Business Critical also comes with PCI DSS Level 1, for sensitive credit card data and payment details.

Meet Data Residency Requirements

Keep data within a specified cloud provider, geography and region that you select. This allows security teams to meet data residency requirements, pursue multi-cloud strategies and set up failover infrastructures for continuity.

Improve Access Control and Visibility

Control who can access your enterprise data, with a master key for data and credentials encryption. Disable access to the key at any time to stop Fivetran from accessing your data. You also have the option of US-only support.

Business Critical Features

When you select Business Critical you are choosing the most secure data integration platform to protect your sensitive data. Business Critical has everything on our Enterprise plan, plus the below features, and unlocks the option to select US-only support.

Customer Managed Keys	Private Connectivity	Data center region selection	PCI DSS Level 1 Compliance
Hold master keys for your data encryption for the ability to restrict access at any time with AWS KMS, Azure Key Vault or Google Cloud KMS.	Avoid exposing data over the public internet with private networking for AWS PrivateLink, Azure Private Link, or Google Private Service Connect.	Deploy Fivetran across multiple cloud service providers and within specific regions to meet data residency requirements.	Trust Fivetran to handle your sensitive information, including your customer credit card and payments data.
