

Environmental & Compliance Policy

EcoMatter is committed to responsible sourcing, regulatory compliance, traceability and environmentally sound recovery of waste-derived materials. This policy sets out the principles applied to our commercial relationships and waste-management activities.

1. Purpose & Scope

This policy applies to EcoMatter's sourcing, trading, coordination and supply activities involving waste-derived materials, including RDF/SRF and related non-hazardous waste streams. It provides a framework for compliance-focused decision-making throughout the commercial and logistics chain.

2. Regulatory Compliance

EcoMatter seeks to conduct activities in accordance with applicable European Union and national waste legislation. Each transaction is assessed according to the waste classification, origin, destination, intended recovery operation and the permits or authorisations required for the parties involved.

3. Partner Due Diligence

Before establishing or maintaining material business relationships, EcoMatter may verify relevant company information, operational authorisations, facility permits, waste-management capabilities and other compliance information appropriate to the transaction. Commercial partners are expected to provide accurate and current documentation when reasonably requested.

4. Waste Classification & Traceability

Waste streams should be classified using the applicable European List of Waste (LoW/EWC) code based on their actual origin, composition and treatment process. EcoMatter promotes traceability through appropriate commercial, transport and waste documentation and does not treat an EWC code alone as proof of regulatory eligibility.

5. Cross-Border Shipments

Cross-border movements of waste must follow the applicable shipment regime and competent-authority requirements. Before shipment, the parties should establish the relevant classification, recovery destination, contractual responsibilities, required notifications or consents where applicable, and accompanying documentation.

6. Environmental Responsibility

EcoMatter prioritises recovery routes that support resource efficiency and responsible use of waste-derived materials. Our objective is to connect suitable material streams with verified recovery facilities while supporting reduction of landfill dependence and responsible substitution of conventional fuels where technically and legally appropriate.

7. Documentation & Record Keeping

Relevant transaction records should be retained in accordance with applicable legal and contractual requirements. These may include contracts, specifications, analyses, transport records, shipment documentation, permits, confirmations of receipt and recovery documentation.

8. Continuous Improvement

EcoMatter aims to review its compliance processes as legislation, market practices and operational requirements evolve. Where a compliance concern is identified, the relevant transaction may be paused until sufficient information is obtained and the issue is appropriately addressed.

This policy is a corporate statement of principles and does not replace permits, official approvals, shipment notifications, contractual obligations or legal advice. Applicable legislation and decisions of competent authorities prevail.
