

Case I

Liam, aged 42
Weight: 81 kg

- Liam is a 42-year-old male who is diagnosed with congenital haemophilia A with a FVIII activity of 8%
- He has provided informed consent
- His medical history reveals that he has concomitant hypothyroidism that is treated with levothyroxine, which requires to be taken on an empty stomach at least 30 min before a meal

Case II

Mateo, aged 29
Weight: 68 kg

- Mateo is a 29-year-old male who is diagnosed with congenital haemophilia A with a FVIII activity of 5%
- He is otherwise healthy and has provided informed consent
- He was on emicizumab prophylaxis until 6 months before screening and then switched to on-demand treatment

Case III

Omar, aged 47
Weight: 87 kg

- Omar is a 47-year-old male who is diagnosed with congenital haemophilia A with a FVIII activity of 12%
- He is otherwise healthy and has provided informed consent
- His medical history reveals that the patient was diagnosed with a gastric peptic ulcer, HP+, 2 years ago, which was successfully treated
